

Two-Stage Compression for Tank Car Unloading and Recovery

Tired of Not Getting All of the Propane You Paid For?

Reason: Single-Stage Compression

A single-stage compressor cannot efficiently recover residual vapor without damaging the compressor, so you are not getting all of the propane you paid for.

Solution: Two-Stage Compression

A two-stage compressor pulls a tank car down to zero psig without damaging the compressor and recovers all residual vapor.

Turn losses into profits with a two-stage D791

- Recovers an additional 230 gallons of liquid LPG or more per tank car.
- In many cases a model D791 pays for itself in less than one year.
- One model D791 supports up to four tank cars at one time.

Solutions beyond products...
